Water Treatment Handbook, Degremont, 1979. Fifth English Edition.
FIRMIN-DIDOT S.A. PARIS, 1186 pp.

This fifth English edition of Water Treatment Handbook is the work of 25 members of staff of the French company Degremont. The third English edition ran to 653 pages, so that the Handbook has increased by 50% since that appeared in 1965.

Part one deals with General Aspects of Water and Water Treatment in three chapters on water science, its action on materials and the theory of treatment processes. Treatment Plant and Processes are covered in Part Two in sixteen chapters on coagulation, precipitation, settlement, aerobic treatment, filtration, ion exchange, sludge treatment etc. It is at this part that the reader realises that the term water includes domestic sewage and industrial wastewater. In future editions it would be worth devoting space to explaining that the treatment of water and wastewater are tending to become different facets of the same subject and that because of the similarity of the principles of treatment and the plant in which treatment is carried out it is logical to describe unit processes that may be applicable to both. Even so it would be necessary to point out the differences in, for example, the settlement of a silt-laden river water and the removal by settlement of the highly fermentable suspended solid matter in the wastewater from, say, food processing operations.

If it is logical to deal with treatment in a series of chapters on unit processes, the same logical approach could be applied to the treatment of other subjects, such as the chemistry and biology of water and wastewaters. Such a major recasting of a work which has obviously come to stay, and will continue through new editions, would have advantages in unifying such growing subjects as standards, water quality objectives and the re-use, after treatment of secondary effluents. It would then not be out of place to mention the growing importance of the disposal of liquid sludge on land as an agricultural outlet for a waste product, little profit though there may be for the equipment manufacturer in this beneficial method of disposal.

The information contained in the book is of universal application and interest, as shown by the sections that concern themselves with the treatment of water appropriate to the use of the water, to standards that are used in different countries and to their legislative methods of controlling water quality.

Since the Fifth English edition appears to correspond to the Eighth French version published in 1978, perhaps it is expecting too much to see any extensive reference to the synthetic chemicals derived from industrial wastewaters and run off waters that may appear in raw water supplies and even in some treated waters. The growing concern this is causing and the attention which is being paid, particularly in the USA and USSR to the identification of such chemicals and their limitation by statutory methods, suggest that this is a subject to which special attention should be given in subsequent editions of the Handbook.

The Handbook is packed with information essential to the water scientist, technologist and engineer and it is concisely given, amply supported by statistical information and, except for a few fuzzy microphotographs of microorganisms well and profusely illustrated. It should find a place among the reference of all practising water and wastewater engineers and plant operators.
